RTLDI ATLAS 2026

Right to Life Deficit Index for United Nations Member States

Identifying capital exclusions: lost potential GDP associated with missing foundational protections. Contextually bounded with a 25% institutional cap.

GLOBAL CAPITAL EXCLUSIONS	UN MEMBER STATES	COEFFICIENT ETA
$19.29T	193	0.36
annual, capped	22 regions	population-weighted

Based on Sid J.A. Hubbard, Causality and Attraction: A Continuum of Steady States (Version 3, May 2026), DOI 10.5281/zenodo.19468550

Data: V-Dem 2024 components + latest World Bank GDP baseline as of 2026. Prepared for NGOs, researchers, policymakers, analysts, and public-interest users.

Publication Record, Rights, and Citation

EDITION

RTLDI Atlas of UN Member States, 2026 print edition. Generated from the corrected nine-lever public pipeline and synchronized with the web atlas, interactive map, Full Data View, and linked-data export.

PROJECT AND AUTHORSHIP

Published by the RTLDI Atlas Project. Sid J.A. Hubbard is Principal Investigator and is responsible for the project's methods, decisions, interpretation, engineering direction, and publication.

RIGHTS

The RTLDI Atlas repository — code, data-processing pipeline, project documentation, and generated outputs — is open source under the MIT License. The underlying theoretical framework and book content are separate works. Causality and Attraction remains under its original copyright and CC BY-NC-ND 4.0 terms and is not relicensed by the repository's MIT License.

RECOMMENDED CITATION

About the RTLDI Atlas

The RTLDI Atlas is an open, reproducible atlas of the conditions that protect human life and allow capital to operate across all 193 United Nations Member States. It originates in Sid J.A. Hubbard's Causality and Attraction: A Continuum of Steady States, Volume I. The Atlas operationalizes the book's Right-to-Life Protection method by translating nine protections into country classifications, an RTLP score, the Right to Life Deficit Index, and bounded estimates of capital exclusion.

PRODUCTION DISCLOSURE

At this stage, the entirety of the Atlas project is written, directed, and engineered by its Principal Investigator with the assistance of multiple AI and data-science tools used in research, software development, analysis, validation, and production. Responsibility for the project's methods, decisions, interpretations, and releases rests with the Principal Investigator.

CONTRIBUTING PUBLIC PROJECTS

V-Dem supplies the institutional measurements used for levers 1–8. World Bank World Development Indicators supply GDP, population, undernourishment, and poverty observations. The United Nations Member States list defines the 193-country scope. These projects provide source observations; RTLP, RTLDI, lever classifications, capital-exclusion estimates, maps, and generated atlas products are RTLDI Atlas Project outputs.

Contents and Reading Sequence

PART I

Project record and global overview

About, methods, responsible interpretation, global map, and 193-country summary.

PART II

UN regional summaries

Twenty-two regional comparisons with common metrics, maps, and lever breakdowns.

PART III

Nation profiles

One page for each UN Member State, ordered alphabetically.

PART IV

Eurozone focused report

A 21-member shared-currency comparison using the canonical global model.

PART V

Evidence, data, and project record

Executable crosswalk, regression, datasets, attribution, source access, glossary, and credits.

QR title pages introduce the regional summaries, nation profiles, Eurozone maps, and glossary/source section. Every other printed web link is paired with a compact QR symbol, and every destination is also printed as a URL so access does not depend on QR scanning.

Executive Description

The RTLDI — Right to Life Deficit Index — is taken from the source framework (Hubbard, Zenodo 10.5281/zenodo.19468550) and extended here to estimate potential GDP statistically associated with missing protections.

The Atlas calls this modeled quantity "capital exclusions." The corrected 2026 cross-sectional model estimates $19.29T in bounded annual capital exclusions. It is not observed money, a causal estimate for any single lever, or a guaranteed reform dividend.

This 2026 Atlas applies the source RTLDI to all 193 UN Member States using V-Dem 2024 observations and the most recent World Bank baseline assembled for the edition. A population-weighted cross-sectional regression estimates the association between activated protections and GDP per capita. The projection is then bounded so the nine conditions are never assigned more than 25% of observed GDP.

This is practical economic intelligence, not a causal forecast or judgment on nations. The atlas identifies where specific protections are absent and reports the bounded economic scale associated with those absences. Raw observations, thresholds, regression evidence, uncertainty, and source ownership are disclosed in the evidence section.

Methodology and Data Sources

RTLP Score (R)
R is the simple average of nine binary indicators (0 = no protection, 1 = full protection). Eight indicators are derived from V-Dem country-year observations (2024 score year; current reproducible workflow targets v16) using the following thresholds (higher = stronger protection):

1. Legal Protections — v2cltrnslw ≥ 2.0
2. Independent Judiciary — average(v2juhcind, v2juncind) ≥ 2.0
3. Law Enforcement Accountability — v2clkill ≥ 2.0
4. Protection Against Arbitrary Detention — v2xcl_acjst ≥ 0.5
5. Freedom from Torture — v2cltort ≥ 2.0
6. Civilian Protection in Conflict — v2x_clphy ≥ 0.5
7. Access to Justice — v2clrspct ≥ 2.0
8. Freedom of Expression & Whistleblower Protections — v2x_freexp ≥ 0.5

9. Socioeconomic Conditions — World Bank: undernourishment ≤ 5 % AND poverty headcount ($2.15) ≤ 10 %.

R = (number of 'Yes' indicators) / 9

Economic Projection
ΔG (per-capita) = min($\eta \times (1 - R) \times G_0$, $0.25 \times G_0$) with operational η=0.36. The regression estimate is 0.356; the separate 25% contextual cap bounds attribution. G_0 is the most recent published GDP per capita used by this edition. Total capital exclusions = $\Delta G \times$ population.

Data Vintage Note for 2026 Edition
V-Dem components reflect the latest available year in the source file (2024). GDP per capita (G_0) uses the freshest published values available at the time of atlas production. This follows the principle that RTLP governance scores are relatively stable year-to-year while GDP is the more dynamic variable in the equation.

Causal Projection from Outer Enclosures

Causal projection distinguishes a change in what can happen from a forecast that says exactly what will happen next. An outer enclosure is a protective institutional boundary around the actions of people inside a system. Switching a lever changes that boundary and therefore changes the feasible set of responses. Movement becomes possible; its timing, scale, and path remain contingent.

THE PROJECTION

A causal projection follows the consequences of opening or closing a pathway. While a protection is absent, benefits that require that protected pathway are structurally unavailable. Once an effective protection is present, those benefits enter the system's reachable set. This is an institutional availability claim, not a point prediction of immediate GDP movement. Implementation, credibility, enforcement, information, and the choices of real actors still determine realization.

WORKED EXAMPLE: WHISTLEBLOWER PROTECTION

Corruption commonly produces a financial benefit for the people or organizations sustaining it. Insiders are often best placed to reveal the arrangement. Without credible protection from dismissal, prosecution, violence, or other retaliation, disclosure can impose concentrated personal costs while the beneficiaries retain the corrupt rent. Corruption is not logically guaranteed in every unprotected system, but concealment is favored and the protected inside-to-outside evidence channel is closed or severely constrained.

Effective whistleblower protection opens that channel. A protected disclosure, investigation, recovery, and deterrence pathway becomes institutionally available. The reform does not guarantee that a whistleblower appears immediately, that enforcement succeeds, or that a particular sum is recovered. It does guarantee the relevant change in modeled possibility: a benefit that cannot be reached through a protected reporting channel while that channel is absent can become reachable once the channel exists and is credible.

EVIDENCE AND CLAIM BOUNDARY

The Atlas cross-section shows that high-RTLP countries are generally more prosperous, supporting the direction and economic relevance of the projection. It does not establish that one newly activated lever alone causes the full estimated difference. The defensible causal statement is that effective outer enclosures remove specified barriers and create institutional option value; realized gains remain empirical outcomes to measure after a lever change.

Reading and Using the Atlas

Begin with R, the share of nine protections meeting the operational thresholds. Read the green/red lever strip to identify which conditions are present, then inspect each raw value rather than treating the binary classification as the whole observation. G_0 is the GDP-per-capita baseline. ΔG is the bounded per-capita capital-exclusion estimate; the national total multiplies ΔG by population.

Regional pages support comparison inside a shared geographic context. Nation pages support diagnosis of one country. The Eurozone report applies the same global coefficient to a shared-currency subset. Lever-level amounts allocate a country's bounded total across missing components; they are not nine independent causal estimates.

Policymakers and civil society can use the profiles to identify candidate reforms and questions for deeper investigation. Analysts should use the Full Data View and source fields for comparison. Investors should treat the results as one governance-risk lens, not as investment advice or a forecast.

Interpretation, Scope, and Limitations

Association is not causal identification. The regression is cross-sectional and may reflect omitted variables, reverse causation, measurement error, model specification, and common causes of both institutional protection and GDP. The one-year growth check reported in the evidence section is not statistically significant.

R uses V-Dem 2024 observations paired with the freshest World Bank values assembled for the 2026 baseline. Binarization thresholds and proxy choices are RTLDI Atlas Project operationalizations. Missing socioeconomic observations are conservatively scored as lever 9 absent. Current-US-dollar GDP includes exchange-rate and price-level movement.

The operational eta is 0.36, based on a corrected estimate of 0.356. The separate 25% contextual cap prevents the model from assigning more than one quarter of observed GDP to the nine conditions. That bound limits the claim but does not establish the counterfactual. Whether any measured exclusion is realized after reform depends on industry, resources, human capital, geography, conflict, history, implementation quality, and other conditions outside this reduced model.

Cartographic Approach and the Nested Map

All choropleths use the Mollweide equal-area projection via standard tools. This ensures accurate area representation, full reproducibility, and accessibility for NGOs. The maps are generated once and embedded in the PDF so that every reader sees the same visual data.

Canonical Global Choropleth — Enclosure Strength (R)

Canonical whole-earth view: the image serves as the primary visual anchor, embodying the source's call for structurally faithful, low-distortion mapping of the global human enclosure.

Mollweide equal-area projection. Primary anchor for accuracy and nested wholeness (source Ch. 2). Regional and nation views throughout the atlas use the same RTLDI atlas R scale.

GLOBAL CAPITAL EXCLUSIONS BY LEVER

#	Lever	Annual Capital Exclusions	% total
7	Access to justice	$3.39T	17.6%
	Ordinary people can bring serious claims and have them heard fairly.		
5	Freedom from torture	$3.31T	17.2%
	Measures are in place to prevent torture and inhumane treatment.		
2	Independent judiciary	$3.22T	16.7%
	Courts can uphold right-to-life laws, including against the state.		
1	Legal protections	$3.16T	16.4%
	Ordinary law applies consistently to state agents and everyone else.		
9	Basic human security	$1.91T	9.9%
	A minimum floor against extreme deprivation is maintained.		
3	Law enforcement accountability	$1.45T	7.5%
	Law enforcement agencies are accountable for unlawful killings and violence.		
4	Arbitrary detention protection	$1.01T	5.2%
	Arbitrary detention is prohibited with real legal recourse.		
8	Expression and whistleblowers	$993.5B	5.2%
	Expression and whistleblower rights are protected from retaliation.		
6	Civilian protection in conflict	$834.8B	4.3%
	Mechanisms protect civilians during conflict.		

These figures paint a picture of a world where the greatest measured disparities are associated with access to justice, preventing torture and inhumane treatment, independent judiciaries, and basic legal protections—together accounting for a large share of the bounded global total. The associated exclusions are comparatively lower for civilian protection in conflict, freedom of expression and whistleblowing, and protection against arbitrary detention. Socioeconomic shortfalls remain a persistent burden. After applying the contextual cap derived from case studies of archetypal nations, the data show how weaknesses in the nine core protections are linked to substantial differences in prosperity once other determinants (resources, industry, history, location) are credited.

Total modeled global capital exclusions: $19.29 trillion. This bounded cross-sectional estimate is associated with missing protections; it is not directly observed capital or a guaranteed causal effect.

Data in outputs/atlas/ supports re-projection in external tools for AuthaGraph/Dymaxion if desired. See source Ch. 2 and Epilogue on maps and nested causality (DOI 10.5281/zenodo.19468550).

Summary Table of All 193 UN Member Nations

Sorted by estimated total annual GDP loss (highest first). R = RTLP score (0–1); values shown as fraction of 9 indicators where possible. Losses in current USD using 2026 baseline GDP per capita paired with latest available RTLP components (2024).

#	Country	Region	R	Per Capita Capital Exclu	Capital Exclusions (USD)	Population

PART II / PRINT AND WEB

UN Regional Summaries

Twenty-two comparable geographic views, with direct access to the interactive Web Atlas.

https://sjah9.github.io/rtldi-atlas/outputs/html-atlas/

The summaries that follow use the same 193 canonical country records. Scan to compare regions, open countries, and inspect every lever online.

Scan with a phone camera or use the printed URL. QR destination verified at production time.
