RTLDI ATLAS 2026

Right to Life Deficit Index for United Nations Member States

Identifying capital exclusions: lost potential GDP associated with missing foundational protections. Contextually bounded with a 25% institutional cap.

GLOBAL CAPITAL EXCLUSIONS	UN MEMBER STATES	COEFFICIENT ETA
$19.29T	193	0.30
annual, capped	22 regions	population-weighted

Based on Sid J.A. Hubbard, Causality and Attraction: A Continuum of Steady States (Version 3, May 2026), DOI 10.5281/zenodo.19468550

Data: V-Dem 2024 components + latest World Bank GDP baseline as of 2026. Prepared for NGOs, researchers, policymakers, analysts, and public-interest users.

Executive Description

The RTLDI — Right to Life Deficit Index — is taken from the source framework (Hubbard, Zenodo 10.5281/zenodo.19468550) and extended here so that the world can see and capture the lost potential GDP caused by missing protections.

We call this lost potential GDP "capital exclusions": places and economies where capital is excluded from productive use because the nine foundational protections necessary for it to operate safely are not present. The RTLDI shows that the global economy currently has approximately 15 trillion dollars in capital exclusions sitting outside the economy — waiting for nations to decide to put the necessary protections in place.

This 2026 Atlas applies the source RTLDI to all 193 UN Member States using V-Dem (2024 components) and the most recent World Bank GDP per capita data. Through population-weighted regression analysis of countries that have these protections versus those that do not, and with a conservative 25% attribution (the portion of observed national wealth associated with the institutional capacity to protect life and capital), the atlas quantifies the scale of these exclusions. The nine levers are low-cost, high-return institutional conditions. Activating them is how nations can bring excluded capital back into the economy.

This is practical economic intelligence. The findings are not judgments on nations but measurements of where specific, actionable protections correspond to large capital exclusions (lost potential GDP). The nine levers and the method behind the extension are described in the sections that follow.

Methodology and Data Sources

RTLP Score (R)
R is the simple average of nine binary indicators (0 = no protection, 1 = full protection). Eight indicators are derived from V-Dem country-year observations (2024 score year; current reproducible workflow targets v16) using the following thresholds (higher = stronger protection):

1. Legal Protections — v2cltrnslw ≥ 2.0
2. Independent Judiciary — average(v2juhcind, v2juncind) ≥ 2.0
3. Law Enforcement Accountability — v2clkill ≥ 2.0
4. Protection Against Arbitrary Detention — v2xcl_acjst ≥ 0.5
5. Freedom from Torture — v2cltort ≥ 2.0
6. Civilian Protection in Conflict — v2x_clphy ≥ 0.5
7. Access to Justice — v2clrspct ≥ 2.0
8. Freedom of Expression & Whistleblower Protections — v2x_freexp ≥ 0.5

9. Socioeconomic Conditions — World Bank: undernourishment ≤ 5 % AND poverty headcount ($2.15) ≤ 10 %.

R = (number of 'Yes' indicators) / 9

Economic Projection
ΔG (per-capita) = min($\eta \times (1 - R) \times G_0$, $0.25 \times G_0$) with $\eta \approx 0.30$ (the 25% cap from the regression). G_0 is the most recent published GDP per capita (World Bank, labeled 2026 baseline). Total capital exclusions = $\Delta G \times$ population.

Data Vintage Note for 2026 Edition
V-Dem components reflect the latest available year in the source file (2024). GDP per capita (G_0) uses the freshest published values available at the time of atlas production. This follows the principle that RTLP governance scores are relatively stable year-to-year while GDP is the more dynamic variable in the equation.

Nested Causal Modelling/Mapping

The RTLDI in this atlas begins with the source framework (Hubbard, Zenodo DOI 10.5281/zenodo.19468550) and extends it through population-weighted regression on the full UN cross-section. The target is to quantify "capital exclusions" — the lost potential GDP that exists because the nine foundational protections required for capital to operate safely are not present.

R (0.0 to 1.0) is the simple average of the nine binary indicators from the source. The model is verified by the strong population-weighted correlation between higher R and higher observed GDP. A conservative 25% attribution cap is applied so that no more than one-quarter of any nation's observed wealth is credited to these institutional conditions (the raw regression suggests a higher coefficient, closer to 0.33).

The nine conditions function as the institutional prerequisites that allow capital to enter and remain in an economy without unacceptable risk of arbitrary loss. Where they are absent, capital is excluded. The RTLDI extension makes the scale of these exclusions visible so that nations can see the concrete economic opportunity in putting the protections in place.

Using the RTLDI to Identify Capital Exclusions

This atlas extends the source RTLDI to make visible the capital exclusions — the lost potential GDP — that result when the nine protections are not in place. The global total is on the order of 15 trillion dollars sitting outside productive economic activity.

Governments, investors, and analysts can use the R scores and the 9-component breakdowns to see exactly where specific, low-cost institutional changes correspond to large volumes of currently excluded capital. Activating the levers is how that capital can be brought back into the economy.

The Core Translation

The bounded equation is $\Delta G = \min(\eta \times (1 - R) \times G_0 , 0.25 \times G_0)$ with $\eta \approx 0.30$ from the population-weighted 2026 cross-section.

R is the average of the nine binary indicators from the source RTLDI. G_0 is GDP per capita. ΔG is the estimated per-person capital exclusion (lost potential GDP) associated with the current level of these protections (capped so the nine indicators are never credited with more than 25% of observed G_0 after other factors are given their due). Total capital exclusions $\approx \Delta G \times$ population.

A country with R = 0.44 and G_0 = \$10,000 shows roughly \$1,512 per person per year in capital exclusions under the current cross-sectional relationship (0.30 × 0.56 × 10,000). The 25% cap is the conservative adjustment from the population-weighted regression. The figure is the measured volume of capital currently excluded from that economy — the potential GDP that can be brought back in once the protections are in place.

The Nine Levers

Each lever is a simple binary condition — either present or absent. When present, it removes a barrier that otherwise excludes capital from the economy. The nine levers were identified by the source modelling (extended here via population-weighted regression) with the target of maximal economic scale. Activating them is how nations can reduce capital exclusions and bring excluded GDP back into productive use.

1. Legal Protections
Present when ordinary law is applied consistently to state agents as well as everyone else. These protections represent opportunities to support greater economic scale by lowering the risk of arbitrary loss; people and businesses invest and trade more when rules are known and fairly enforced. Annual cost is low.

2. Independent Judiciary
Present when judges are protected from political pressure so they rule according to law. These protections represent opportunities for contracts and property rights to be reliable for everyone. Annual cost is low.

3. Law Enforcement Accountability
Present when police and security forces are investigated and punished when they break the law. These protections represent opportunities for people to travel, work, and invest with greater security. Annual cost is low.

4. Protection Against Arbitrary Detention
Present when no one can be held without charge, time limits, or judicial review. These protections represent opportunities to protect continuity of talent and enterprise. Annual cost is low.

5. Freedom from Torture
Present when torture is a crime with no exceptions and evidence obtained by it is excluded. These protections represent opportunities to build social trust and accurate information flows. Annual cost is low.

6. Civilian Protection in Conflict
Present when armed forces distinguish civilians from combatants and are held accountable. These protections represent opportunities to preserve human and physical capital for recovery. Annual cost is training and accountability.

7. Access to Justice
Present when ordinary people can bring serious claims against the powerful and have them heard. These protections represent opportunities for contracts and rights to be meaningful for everyone. Annual cost is legal aid and court capacity.

8. Freedom of Expression & Whistleblower Protections
Present when laws protect people who report government corruption from retaliation. These protections represent opportunities for corruption to be exposed and stopped, public money to go further, and investors to see lower risk. Annual cost is low — mainly passing and enforcing the law. When the law protects whistleblowers, the whistles blow and tell you where the corruption is.

9. Commitment to Basic Human Security
Present when a society deliberately sets and maintains a floor against extreme deprivation (through nutrition, basic health access, and minimal material security). This is a measurable expression of political will and institutional priority. When present, it expands the share of the population that can participate productively in the economy, increasing overall scale and velocity. Annual cost is a fiscal and political choice about minimum security standards.

These nine work together as a system of low-cost, high-return institutional conditions. Societies that activate more of them consistently realize greater economic scale and velocity.

How the Levers Work in Practice

Each lever is either present or absent. When present, it removes a barrier that otherwise excludes capital from the economy. The nine levers come from the source RTLDI and are extended here so the volume of capital exclusions (lost potential GDP) associated with each missing lever becomes visible.

Governments, investors, and analysts can use the R score and the 9-component breakdown as practical economic intelligence: identify which levers are not yet activated in a jurisdiction and see the corresponding scale of excluded capital that could be brought back in once the protections are in place. The levers are low-cost relative to the GDP they help unlock.

Practical Use

For national policymakers: Open your profile. Note your R and the specific levers that are not yet activated. Compare the total annual capital exclusions (lost potential GDP) in your jurisdiction to relevant budgets. Ask the civil service to cost the effort required to activate one or two levers and the volume of excluded capital that could be brought back into the economy.

For civil society and media: Use the numbers in domestic advocacy to highlight the opportunity. 'We have $2.3 billion in capital exclusions every year associated with law enforcement accountability. That is more than the entire health budget. Here is one change that can bring that excluded capital back in.'

For citizens: The data is public. When leaders promise 'development,' ask which of the nine protections they will strengthen and how we will know in four years whether R has moved — and what capital exclusions that could eliminate.

For international actors: Target governance and security assistance to the specific levers that currently show the largest capital exclusions in that country.

Limitations

R uses 2024 V-Dem data paired with the freshest published GDP figures. Binarization thresholds are modeling choices; always examine the raw values. The 25 % cap is a deliberate conservative adjustment from the population-weighted regression on the UN cross-section (raw analysis suggests a higher coefficient, closer to 0.33). The identity of the levers with the largest associated capital exclusions is more robust than the precise dollar figure. The atlas quantifies the scale of exclusions based on the source RTLDI; whether and how much capital returns when protections are strengthened depends on many other factors.

Cartographic Approach and the Nested Map

All choropleths use the Mollweide equal-area projection via standard tools. This ensures accurate area representation, full reproducibility, and accessibility for NGOs. The maps are generated once and embedded in the PDF so that every reader sees the same visual data.

Canonical Global Choropleth — Enclosure Strength (R)

Canonical whole-earth view: the image serves as the primary visual anchor, embodying the source's call for structurally faithful, low-distortion mapping of the global human enclosure.

Mollweide equal-area projection. Primary anchor for accuracy and nested wholeness (source Ch. 2). Regional and nation views throughout the atlas use the same RTLDI atlas R scale.

GLOBAL CAPITAL EXCLUSIONS BY LEVER

#	Lever	Annual Capital Exclusions	% total
7	Access to justice	$3.39T	17.6%
	Ordinary people can bring serious claims and have them heard fairly.		
5	Freedom from torture	$3.31T	17.2%
	Measures are in place to prevent torture and inhumane treatment.		
2	Independent judiciary	$3.22T	16.7%
	Courts can uphold right-to-life laws, including against the state.		
1	Legal protections	$3.16T	16.4%
	Ordinary law applies consistently to state agents and everyone else.		
9	Basic human security	$1.91T	9.9%
	A minimum floor against extreme deprivation is maintained.		
3	Law enforcement accountability	$1.45T	7.5%
	Law enforcement agencies are accountable for unlawful killings and violence.		
4	Arbitrary detention protection	$1.01T	5.2%
	Arbitrary detention is prohibited with real legal recourse.		
8	Expression and whistleblowers	$993.5B	5.2%
	Expression and whistleblower rights are protected from retaliation.		
6	Civilian protection in conflict	$834.8B	4.3%
	Mechanisms protect civilians during conflict.		

These figures paint a picture of a world where the greatest measured disparities are associated with access to justice, preventing torture and inhumane treatment, independent judiciaries, and basic legal protections—together accounting for a large share of the bounded global total. The associated exclusions are comparatively lower for civilian protection in conflict, freedom of expression and whistleblowing, and protection against arbitrary detention. Socioeconomic shortfalls remain a persistent burden. After applying the contextual cap derived from case studies of archetypal nations, the data show how weaknesses in the nine core protections are linked to substantial differences in prosperity once other determinants (resources, industry, history, location) are credited.

Total global capital exclusions: $19.29 trillion. This is lost potential GDP sitting outside the economy because the nine protections are not present.

Data in outputs/atlas/ supports re-projection in external tools for AuthaGraph/Dymaxion if desired. See source Ch. 2 and Epilogue on maps and nested causality (DOI 10.5281/zenodo.19468550).
